Chapter 02: Enamel Cutting Instruments
Boyd: Dental Instruments, 6th Edition

MULTIPLE CHOICE

1. On a three-number enamel cutting instrument, what does the third number indicate?
 - a. Angle of the cutting edge of the blade in relation to the handle in millimeters
 - b. Angle of the blade from the long axis of the shaft in millimeters
 - c. Width of the blade in tenths of millimeters
 - d. Length of the blade in millimeters

ANS: B

On a three-number cutting instrument, the numbers on the handle indicate width, length, and angle of the blade. The third number indicates the angle of the blade.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

2. On a four-number enamel cutting instrument, what does the third number indicate?
 - a. Angle of the cutting edge of the blade in relation to the handle in millimeters
 - b. Angle of the blade from the long axis of the shaft in millimeters
 - c. Width of the blade in tenths of millimeters
 - d. Length of the blade in millimeters

ANS: D

On a four-number instrument, the numbers represent the width of the blade, the angle of the cutting edge, the length of the blade, and the angle of the blade. The third number indicates the length of the blade in millimeters.

REF: Page 19 TOP: CDA, GC, II. Chairside Dental Procedures

3. On a three-number enamel cutting instrument, what does the first number indicate?
 - a. Angle of the cutting edge of the blade in relation to the handle in millimeters
 - b. Angle of the blade from the long axis of the shaft in millimeters
 - c. Width of the blade in tenths of millimeters
 - d. Length of the blade in millimeters

ANS: C

On a three-number cutting instrument, the numbers on the handle indicate width, length, and angle of the blade. The first number indicates the width of the blade in tenths of millimeters.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

4. On a three-number enamel cutting instrument, what does the second number indicate?
 - a. Angle of the cutting edge of the blade in relation to the handle in millimeters
 - b. Angle of the blade from the long axis of the shaft in millimeters
 - c. Width of the blade in tenths of millimeters
 - d. Length of the blade in millimeters

ANS: D

On a three-number cutting instrument, the numbers on the handle indicate width, length, and angle of the blade. The second number on the handle indicates the length of the blade in millimeters.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

5. Which enamel cutting instrument is used to accentuate line and point angles in internal outline and retention in a cavity preparation?
- Hatchet
 - Angle former
 - Straight chisel
 - Binangle chisel
 - Gingival margin trimmer

ANS: B

The angle former is used to accentuate line and point angles in internal outline and retention in a cavity preparation. The hatchet is used to clean and smooth cavity preparation walls. The binangle chisel and straight chisel are used to plane and cleave enamel in a cavity preparation. The gingival margin trimmer bevels the cervical walls of mesial and distal retention areas.

REF: Page 31 TOP: CDA, GC, II. Chairside Dental Procedures

6. The instrument used specifically to bevel the cervical walls (floor) of the mesial and/or distal retention areas of the internal walls of a cavity preparation is a(n)
- hoe.
 - hatchet.
 - angle former.
 - spoon excavator.
 - mesial or distal gingival margin trimmer.

ANS: E

The gingival margin trimmer bevels the cervical walls of mesial and distal retention areas. An enamel hoe is used to clean and smooth the floor and walls. The hatchet is used to clean and smooth cavity preparation walls. The angle former is used to accentuate line and point angles in internal outline and retention in a cavity preparation. A spoon excavator is used to remove caries.

REF: Page 33 TOP: CDA, GC, II. Chairside Dental Procedures

7. The instrument used to remove carious dentin in a cavity preparation is a(n)
- hoe.
 - hatchet.
 - angle former.
 - spoon excavator.
 - mesial or distal gingival margin trimmer.

ANS: D

A spoon excavator is used to remove caries. An enamel hoe is used to clean and smooth the floor and walls. The hatchet is used to clean and smooth cavity preparation walls. The angle former is used to accentuate line and point angles in internal outline and retention in a cavity preparation. The gingival margin trimmer bevels the cervical walls of mesial and distal retention areas.

REF: Page 35 TOP: CDA, GC, II. Chairside Dental Procedures

8. Which of the following is the part of the instrument that attaches the handle to the working end?
- Bevel
 - Blade
 - Shank
 - Beaks

ANS: C

The shank connects the handle to the working end of the instrument. The bevel, blade, and beaks are all part of the working end.

REF: Page 15 TOP: CDA, GC, II. Chairside Dental Procedures

9. Which instrument (or instruments) is used to plane and cleave enamel?
- Angle former
 - Straight chisel
 - Wedelstaedt chisel
 - All of the above.
 - Only B and C are correct.

ANS: E

The Wedelstaedt and straight chisel are designed to plane and cleave enamel. The angle former is used to accentuate line and point angles in internal outline and retention in a cavity preparation.

REF: Page 25 | Page 27

10. Which instrument is used to plane and cleave enamel in a cavity preparation, is used with a push motion, and has two angles for the cutting edges?
- Enamel hoe
 - Straight chisel
 - Enamel hatchet
 - Binangle chisel
 - Wedelstaedt chisel

ANS: D

The binangle chisel has two angled cutting edges and is used with a push motion to plane and cleave enamel. An enamel hoe is used to clean and smooth the floor and walls. The straight chisel and Wedelstaedt chisel are designed to plane and cleave enamel and are used with a push motion, but have only one cutting edge. The hatchet is used to cleave and smooth cavity preparation walls.

REF: Page 29

TOP: CDA, GC, II. Chairside Dental Procedures

11. Which instrument is used to plane and cleave enamel in a cavity preparation, is used with a push motion, has a single angled cutting edge, and has a curved blade?
- Enamel hoe
 - Straight chisel
 - Enamel hatchet
 - Binangle chisel
 - Wedelstaedt chisel

ANS: E

The chisel with the curved blade is the Wedelstaedt. The hatchet, hoe, straight chisel, and binangle chisel do not have a curved blade.

REF: Page 27 TOP: CDA, GC, II. Chairside Dental Procedures

12. Which instrument is used to plane and cleave enamel and to form or accentuate line angles in a cavity preparation, is used with a pulling motion, and has a cutting edge or blade that is almost perpendicular to the handle?
- Enamel hoe
 - Straight chisel
 - Enamel hatchet
 - Binangle chisel
 - Wedelstaedt chisel

ANS: A

The enamel hoe is an instrument that is used with a pulling motion. The blade is nearly perpendicular to the handle. The hatchet and chisels are not used with a pulling motion.

REF: Page 23 TOP: CDA, GC, II. Chairside Dental Procedures

13. An angle former enamel cutting instrument would be found on which instrument tray setup?
- Restorative
 - Endodontic
 - Orthodontic
 - Oral surgery

ANS: A

An angle former enamel cutting instrument would be found on a restorative tray setup.

REF: Page 31 TOP: CDA, GC, II. Chairside Dental Procedures

14. Which enamel cutting instrument is used in a pull motion?
- Enamel hoe
 - Straight chisel
 - Enamel hatchet
 - Binangle chisel
 - Wedelstaedt chisel

ANS: A

The hoe is used with pulling motion. The hatchet and chisels are used with a pushing motion.

REF: Page 23 TOP: CDA, GC, II. Chairside Dental Procedures

15. Which cutting instrument is used to remove decay from the cavity preparation?
- Enamel hoe
 - Straight chisel
 - Enamel hatchet
 - Binangle chisel
 - Spoon excavator

ANS: E

The spoon excavator is used to remove dental caries. A hatchet, hoe, and chisel are used to refine the cavity preparation.

REF: Page 35 TOP: CDA, GC, II. Chairside Dental Procedures

16. If a 15-8-14 enamel hatchet is used in a dental procedure, what is the length of the blade of the instrument?
- 8 mm
 - 14 mm
 - 15 mm

ANS: A

On a three-numbered instrument, the second number represents the length of the blade.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

17. Which of the following hand instruments is an example of a four-number instrument?
- Enamel hoe
 - Spoon excavator
 - Wedelstaedt chisel
 - Distal gingival margin trimmer

ANS: D

The distal gingival margin trimmer is a four-number instrument.

REF: Page 19 TOP: CDA, GC, II. Chairside Dental Procedures

18. Which of the following characteristic describes both the enamel hatchet and enamel hoe?
- They are both used with a push motion.
 - They are both three-number instruments.
 - They can both only be found as a single-ended instrument.
 - Their cutting blades are almost perpendicular to the instrument handle.

ANS: B

Both the hatchet and hoe are three-numbered instruments. They are not used with the same motion, their cutting blades are not in the same configuration, and they are not both available only as single-ended instruments.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

19. What does a spoon excavator remove?
- Cariious dentin
 - Temporary cement
 - Temporary crowns

d. Permanent crown during try-in

ANS: A

The function of a spoon excavator is to remove dental caries. It can also be used to remove temporary cement and crowns as well as a permanent crown during try-in.

REF: Page 35 TOP: CDA, GC, II. Chairside Dental Procedures

20. Which instrument is used to remove unsupported enamel?

- a. Enamel Hoe
- b. Enamel Hatchet
- c. Margin Trimmer
- d. Wedelstaedt Chisel

ANS: B

An enamel hatchet is used to remove unsupported enamel and to clean and smooth the walls of the cavity preparation.

REF: Page 17 TOP: CDA, GC, II. Chairside Dental Procedures

21. Which of the following is a working end of an instrument?

- a. They are both used with a push motion.
- b. They are both three-number instruments.
- c. They can both only be found as a single-ended instrument.
- d. Their cutting blades are almost perpendicular to the instrument handle.

ANS: B

Both the hatchet and hoe are three-numbered instruments. They are not used with the same motion, their cutting blades are not in the same configuration, and they are not both available only as single-ended instruments.
